

Nature-Based Shoreline Workshop *Sustainable Beaches*

Charles Shabica, Ph.D., P.G.

Shabica & Associates
Sustainable Coastal Solutions

The Great Lakes are evolving. We cannot restore the past, but we can cope with the present and prepare for the future by studying nature and our impacts on it

It's hard to plan where we're going without knowing where we've been

The Beginning: Laurentide Glacier ground out the Great Lakes starting 1.5 Million years BP.

Glaciers Melt due to
Climate Change.

And left eroding
rocky shores, sand
plains and clay
bluffs.

Great Lakes Beach History

Natural Beaches:

Sand and cobbles are supplied by eroding lakeshores – rocky cliffs, clay bluffs, relict dunes, and rivers.

Human Activities Accelerate Loss of Natural Sand Beaches:

Armoring bluffs to protect real estate, building dams on rivers and building jetties to protect harbors, all have reduced the sand supply to the coastal system (*sand starvation*).

Today, natural beaches are rare in the Great Lakes, especially in urban areas.

In the northern Great Lakes, the Glacier left: Natural Rocky Headlands - Nature's Pocket Beaches

Photo courtesy JohnBarger@photoshelter.com © John Barger

Apostle Islands National Lakeshore, WI

Photo courtesy Nordic Sports www.n-sport.com

Terrace Bay, Lake Superior

In addition to natural rocky shores, the glacier left open sandy coasts and eroding clay bluffs with ephemeral beaches including:

- **Open Sandy Coasts:** relict sand plains, dunes, marshes, lagoons and beaches. Examples:
 - Presque Isle, PA
 - Illinois Beach State Park
 - Lakeview Wildlife Management Area, NY

- **Eroding Cohesive Clay Bluffs** and ephemeral beaches. Examples:
 - Lake Michigan Illinois North Shore
 - Lake Erie South Shore
 - Lake Ontario South Shore

Sandy Coast: Presque Isle National Lakeshore, Lake Erie.

Problem: diminished sediment supply causes breaches into harbor

After 200 years of stabilization attempts, offshore segmented breakwaters completed 1992

Photo courtesy US Army Corps of Engineers and gazaa.gccaz.edu

Sustainable: Regular updrift beach nourishment

Sandy Coast: Illinois Beach Park, Lake Michigan. Problem: Diminished sand supply updrift, sand chokes Waukegan Harbor downdrift

Sustainability: requires periodic sand backpassing

Photo Courtesy: www.Curtistothethird.com

Beach nourishment or sand backpassing has worked in the past for Illinois Beach State Park

Today is underfunded

Sandy Coast: Lakeview Wildlife Mgmt. Area, NY Lake Ontario: Naturally Eroding coastal sand plains and wetlands. Problems?

Sustainable with sand
management and
proper lake level control.

Photo courtesy Mathew Levine. www.nature.org

For over 50 years, the levels of Lake Ontario and the St. Lawrence River have been regulated by the Moses Saunders Dam. Plan 2014 uses modern simulations to adjust the dam's operating plan to work with nature.

Open Sandy Coast Beach Issues

- **Ecosystem** - A refuge for rare and endangered species. Need to control invasives
- **Beach** - Requires regular beach nourishment or sand backpassing unless erosion is not an issue.
 - **Presque Isle $\pm 35,000$ y³/yr. Underfunded**
 - **Illinois Beach Park $\pm 80,000$ y³/yr. Underfunded**
 - **Lakeview Wildlife Management Area ?**
- **Public Trust** – If some of the riparian property is private, maintenance cost-sharing can be an issue.

Natural Eroding Bluffs and Ephemeral Beaches. Southern shores of Lakes Michigan, Erie and Ontario

Narrow beaches at
low lake levels

No beach at high
lake levels

Eroding Cohesive Clay Bluffs and Ephemeral Beaches.

Loss of Natural Sand Beaches: Armoring bluffs to protect real estate, building dams on rivers and building jetties to protect harbors, all have reduced the sand supply to the system (*sand starvation*). Today, natural beaches are rare in Great Lakes urban areas.

For eroding and *sand-starved* urban shores: structure-held beaches (groins or pocket beaches may be preferred to no action).

Consequence of no action on an
urban eroding lakeshore.

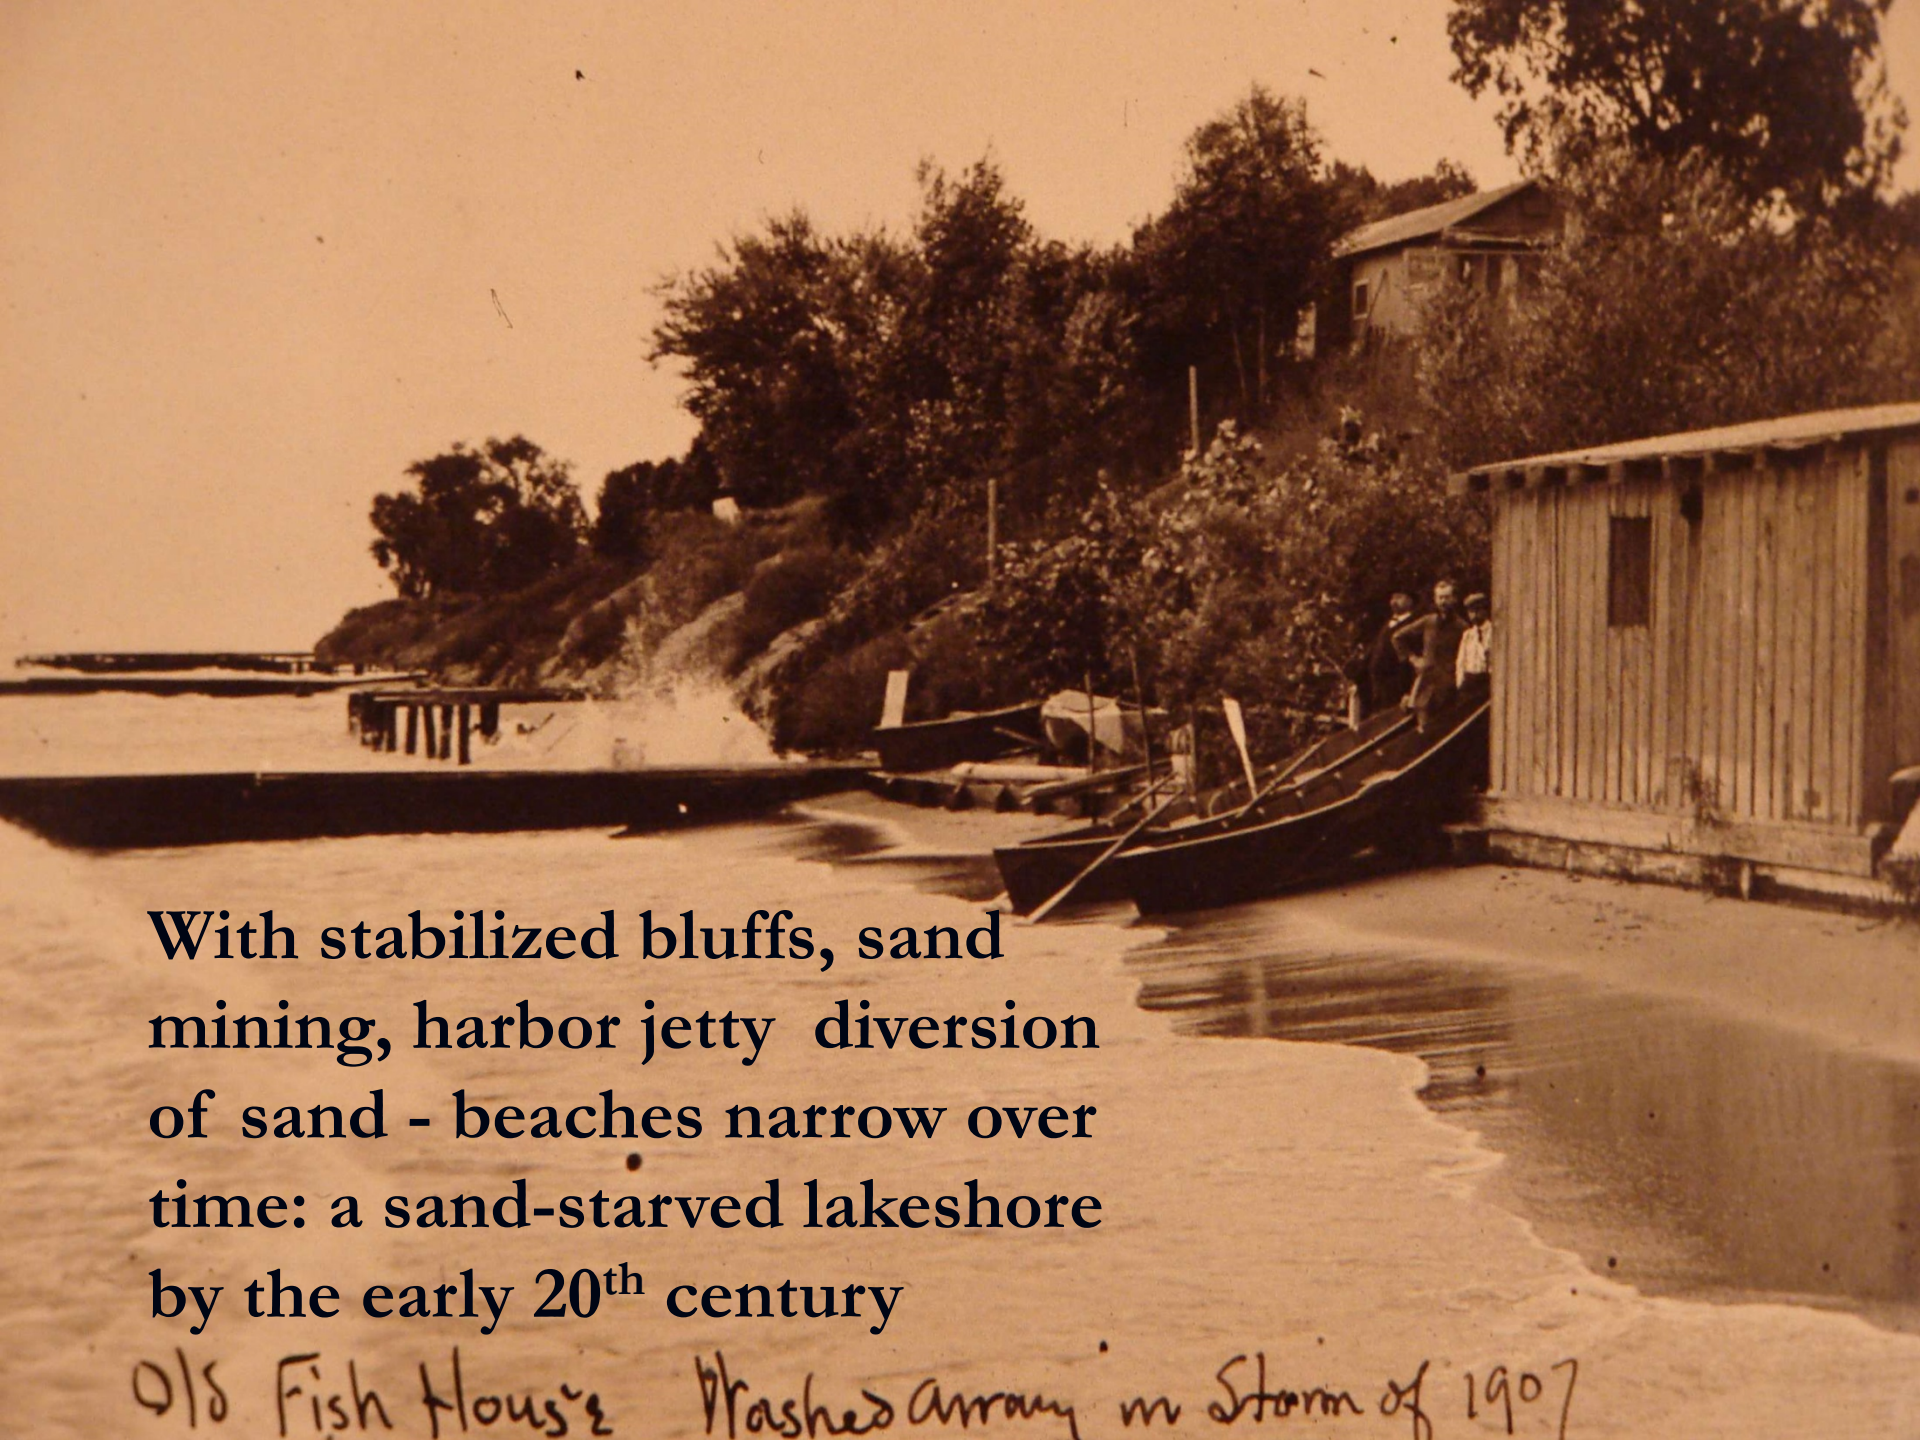

Lessons from the
past: The Illinois
lakeshore, while
only about 60
miles long, has
been impacted by
human activities
for more than 170
years

Illinois has a long
history of bluff
stabilization. Chicago
harbor jetties 1830s and
Evanston piers trapped
sand. Neighbors to the
north learned by
example

View from Winnetka Water Tower 1897

With stabilized bluffs, sand
mining, harbor jetty diversion
of sand - beaches narrow over
time: a sand-starved lakeshore
by the early 20th century

Old Fish House Washed away in Storm of 1907

Evidence: 1989-1992 Sand Survey. Sponsors:
USGS, Sea Grant

The nearshore lakebed is eroding clay. Thin sand deposits

For comparison: Broad sand plain at Illinois Beach Park

After 100 years, most groins are no longer effective at holding sand: Lakebed downcutting

Learn from nature: Rocky headlands and
pocket beaches. Lake Superior

An aerial photograph of the Lake Superior coastline. The image shows a dense green forest covering a large headland that juts into the blue water of the lake. At the base of the forest, a small, light-colored sandy beach is visible, nestled in a cove. The sky is blue with scattered white clouds. In the lower right, a white arrow points to the beach, with the text 'Pocket Beach' next to it.

← Pocket Beach

Forest Park Beach, Lake Forest, Illinois Lake Michigan

Engineered pocket beaches built within surf zone,
pre-filled with sand.

Sunrise Park Beach, Lake Bluff, Illinois. Lake Michigan - 1989
Water treatment plant endangered, bluff eroding

New Pocket Beach 1992

Sunrise Park Beach named ASBPA Top Restored Beach 2012

20+ years of monitoring - requires
approx. 2% new sand annually

Bluff Stabilized with
native plants

1992

Pocket Beaches Issues

■ Design & Engineering

- Full understanding of regional and local processes & evolution
- Solution based on prototype analysis (nearby structures), physical hydraulic model (large structures), numerical modelling

■ Environment –

- 20% sand overfill to assure no negative impact. If cohesive lakebed is eroding will require periodic renourishment
- Maintain littoral drift bypassing - Build well within surf zone. 5 years of monitoring to assure sand bypassing

■ Regulatory and Public Trust –

- State: Privately funded beaches built on state-owned lakebed should be minimal in size and allow public access
- USACE: Structures must be maintained or removed
- EPA: Clean sand and armorstone

Bluffs and beaches can be restored with native species but without intervention will be lost

Foss Park, North Chicago – NOAA/IDNR Grant

Perched Wetland at eroding updrift end of beach

Monitoring 78 Great Lakes (24 in Illinois) pocket beaches –
Stable ecosystems, no negative impact. Native species like
Sea Rocket and Seaside Spurge re-established

Sandy Pocket Beach a Living Shore: Improved Ecosystem

- Erosion – Controlled with natural materials
- Improved Water Quality – Beach sand: a natural filter supporting a robust native bacterial community
- Substrate – rocky headlands, beach dunes and swales – new habitat for plants, fish and shore birds.
- Littoral Drift Sand and Neighbors – Built well within the surf zone and over-filled with new sand. 20+ years monitoring – neighbors happy!

Sometimes intense urbanization requires large-scale solutions: Fills

Chicago River

Chicago - c 1820 wetlands similar to Illinois Beach Park – Flooding is problematic as the city grows

Unmanaged growth left the Chicago lakefront a mess. Railyard revetments help protect the downtown area from storms and flooding

A Grand Solution: *Reclaim land
in the lake.* First large scale
environmental management
plan in USA

1909 Burnham Plan for Chicago

An aerial photograph of the Chicago Lakefill area. The image shows a large body of water, likely Lake Michigan, with a city skyline visible in the background. In the foreground, there are several industrial structures, including a large building with a tall chimney and a smaller structure with a crane. A long pier or breakwater extends into the water, and a small boat is visible near the pier. The water appears calm, and the overall scene is a mix of industrial and natural elements.

Chicago Lakefill – 24 miles of
higher elevation parkland: A
buffer against intense storms,
and rising lake levels

Chicago Lakefill: Beats a seawall next
to the tracks. — A win-win solution!
100th Anniversary in 2009

3

An aerial photograph of the Chicago skyline and Lake Michigan coastline. The city's skyscrapers, including the Willis Tower, are visible in the background. In the foreground, a small peninsula features a circular building with a glass facade and a large, white, dome-shaped structure. The water is a deep blue, and the sky is a clear, pale blue.

**Coping with gradually rising lake
levels and more intense storms.**

And Pocket Beaches! Require minimal maintenance

Municipal Lakefills like Chicago or Toronto are sustainable solutions to intense urbanization and climate change (take note Manhattan Island...)

Toronto Lakefill

If you build it, they will come!

Lessons Learned for the Great Lakes

- Coastal erosion is here to stay
- It is possible to stabilize and preserve the shore with:
 - Engineered lakefills
 - Engineered pocket beaches
 - Sand nourishment and backpassing.
- Eroding lakebed is like rising sea level. **Requires periodic sand re-nourishment**

Wetlands and beaches support a powerful ecosystem. They also greatly improve our quality of life

Photo courtesy: Mommy's free time

courtesy Janpetersondesigns

**We've come a long way -
But have a long way to go!**

**In 2011 there were dozens of swim
bans on Great Lakes beaches often
related to deteriorated
infrastructure: **leaking sewers****

An aerial photograph showing a coastal area. A long, curved breakwater made of rocks extends from the shore into the dark green water. To the right of the breakwater, there is a residential area with several houses, some with dark roofs and others with lighter roofs. A road, labeled 'Powell Dr', runs through the residential area. The text '500 feet' is written in red above the breakwater, with a red line indicating the length. The text 'Spur Breakwater East of Niagara, NY' is written in white below the breakwater. The image is oriented vertically, with the water on the left and the land on the right.

500 feet

Spur Breakwater East of Niagara, NY

Climate Change predictions for the Great Lakes:

- Average temperature up (more evaporation, less winter ice)
- Precipitation up 25%
- Lake levels will continue to vary 4 to 6 feet
- More frequent and intense storms (erosion)
- Beaches will need periodic sand nourishment
