

Sustainable Aquaculture

Teachers!
Check out our curriculum
and lesson plan

Global fisheries have leveled off

The population is increasing

Increases in seafood production must come from aquaculture (fish farming)

Aquaculture is the growing of animals and plants in any aquatic (water) environment

Growers may specialize in one or multiple phases of growth

Growers must address safety and sustainability concerns

Growers seek the goals of fast growth, minimal inputs, and a sustainable, safe product, while preventing the introduction and spread of disease
